Better Content

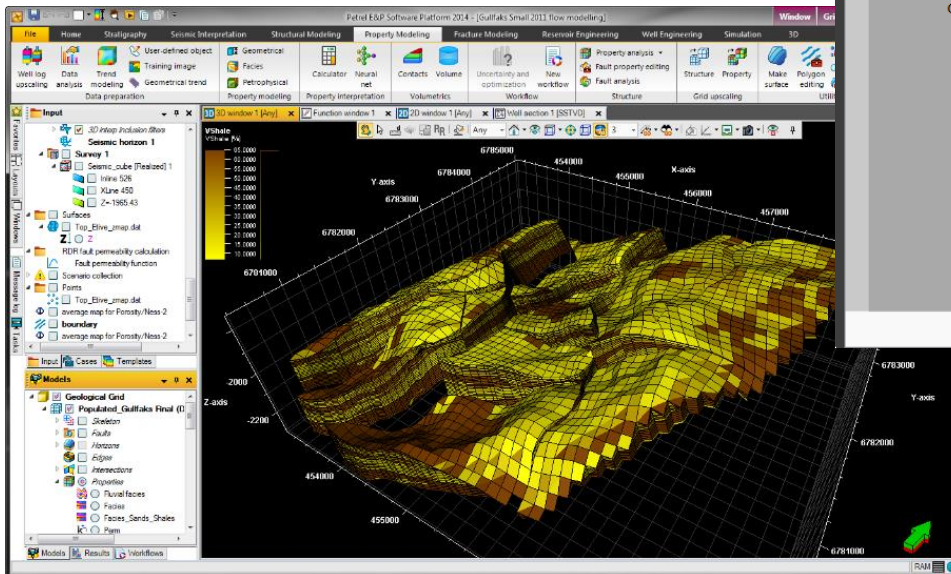

Better Design

Better Results

Petrel Guru module

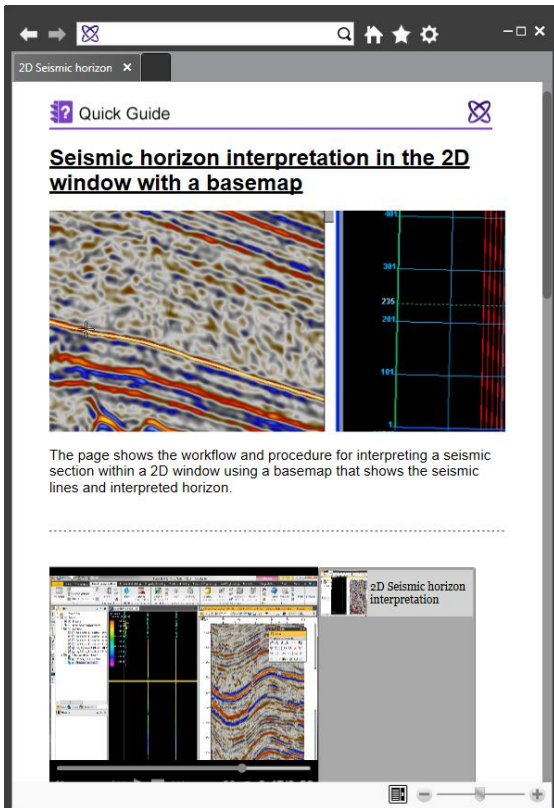

- Support, guidance and training
- Context associated
- Generate your own content
- Guided workflows automate Petrel

Challenges faced by many companies

- Efficiently train new hires to use Petrel
- Enable general users to carry out more complex processes
- Capture knowledge from Petrel experts
- Standardize working practices
- Provide easy to use automation of processes
- Support all users in the transition to new versions of Petrel

Accelerate new users

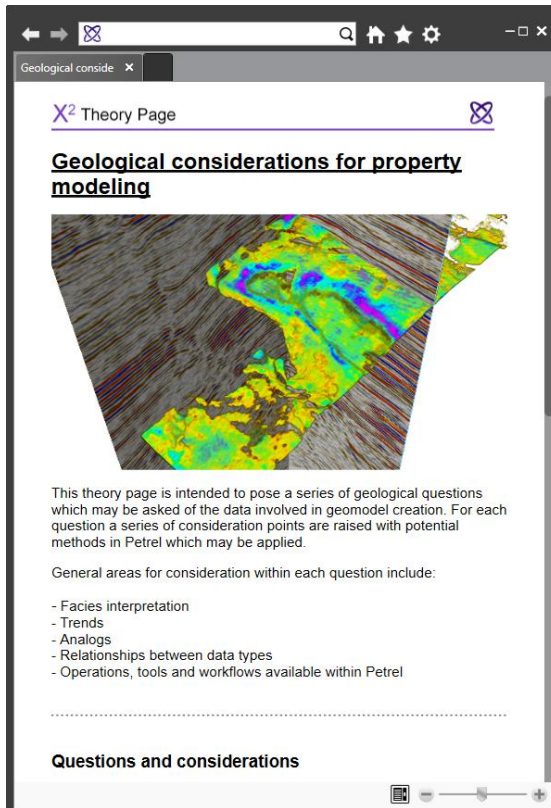

Quick Guide

Seismic horizon interpretation in the 2D window with a basemap

The page shows the workflow and procedure for interpreting a seismic section within a 2D window using a basemap that shows the seismic lines and interpreted horizon.

2D Seismic horizon interpretation

Reduce the learning curve

Theory Page

Geological considerations for property modeling

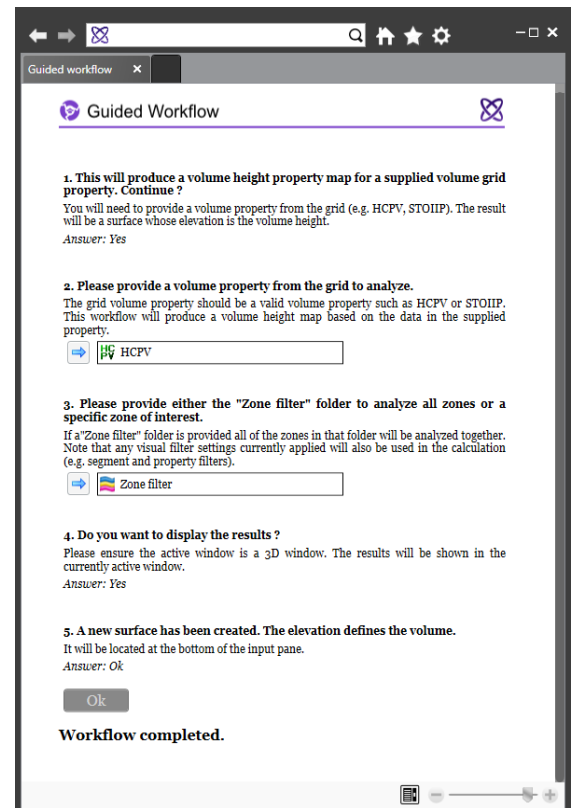

This theory page is intended to pose a series of geological questions which may be asked of the data involved in geomodel creation. For each question a series of consideration points are raised with potential methods in Petrel which may be applied.

General areas for consideration within each question include:

- Facies interpretation
- Trends
- Analogs
- Relationships between data types
- Operations, tools and workflows available within Petrel

Questions and considerations

Leverage expertise

Guided Workflow

- 1. This will produce a volume height property map for a supplied volume grid property. Continue ?**
You will need to provide a volume property from the grid (e.g. HCPV, STOIP). The result will be a surface whose elevation is the volume height.
Answer: Yes
- 2. Please provide a volume property from the grid to analyze.**
The grid volume property should be a valid volume property such as HCPV or STOIP. This workflow will produce a volume height map based on the data in the supplied property.
HCPV
- 3. Please provide either the "Zone filter" folder to analyze all zones or a specific zone of interest.**
If a "Zone filter" folder is provided all of the zones in that folder will be analyzed together. Note that any visual filter settings currently applied will also be used in the calculation (e.g. segment and property filters).
Zone filter
- 4. Do you want to display the results ?**
Please ensure the active window is a 3D window. The results will be shown in the currently active window.
Answer: Yes
- 5. A new surface has been created. The elevation defines the volume.**
It will be located at the bottom of the input pane.
Answer: Ok

Ok

Workflow completed.

Petrel Guru module

- Over 400 video guides and 1000 pages
- Workflows, quality checks, practical exercises, quick guides, good practice and training
- Geophysics, Geology, Reservoir Engineering, Drilling and Shale workflows
- Over 70 Training sequences
- Over 70 pre-created Guided workflows
- Available for Petrel 2010-2014

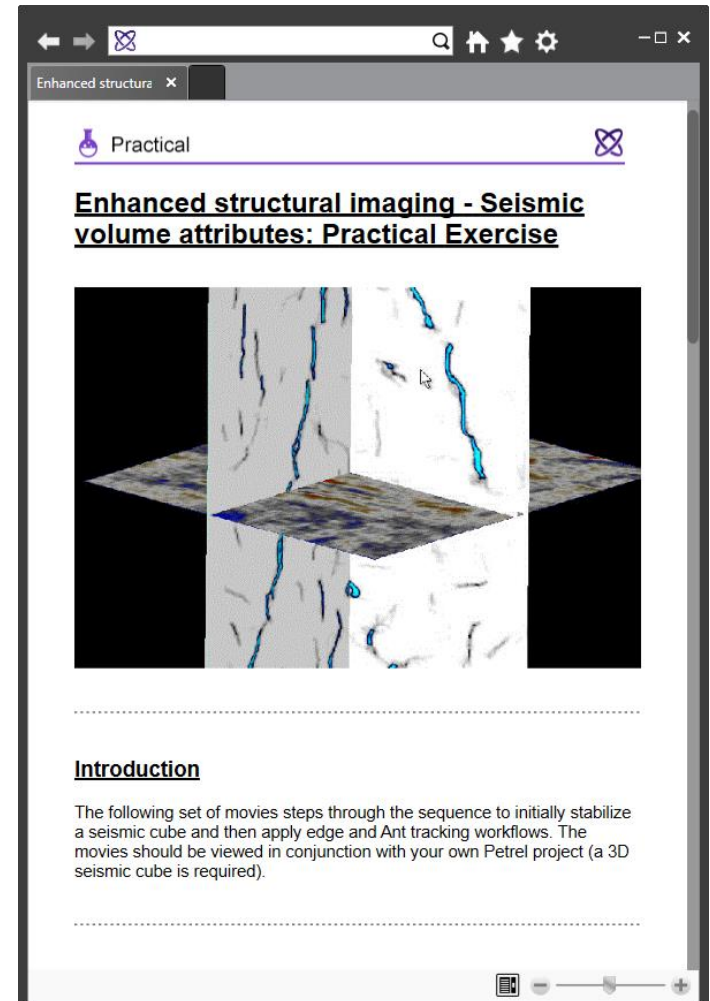

New for 2014

- Streamlined content management
- Cloud hosted content
- Continuous content updates
- Dedicated Shale content

Petrel Guru module

- Greater understanding of Petrel functionality
- More effective use of Petrel
- Greater confidence in using Petrel
- Efficient and in context training
- Company workflows and best practices in Petrel
- Guided workflows
- Standardized working practices

The screenshot shows a web browser window with a single tab titled "Enhanced structural imaging". The page content includes a "Practical" header with a petrel icon, followed by the main title "Enhanced structural imaging - Seismic volume attributes: Practical Exercise". Below the title is a 3D visualization of a seismic volume with blue structural features. The page also contains an "Introduction" section with text describing the sequence of steps for stabilizing a seismic cube and applying edge and Ant tracking workflows. The browser interface includes navigation buttons, a search bar, and window controls.

Enhanced structural imaging - Seismic volume attributes: Practical Exercise

Introduction

The following set of movies steps through the sequence to initially stabilize a seismic cube and then apply edge and Ant tracking workflows. The movies should be viewed in conjunction with your own Petrel project (a 3D seismic cube is required).
